

To-Do List App Documentation

Project Overview

This To-Do List application is developed using Kotlin, Jetpack Compose, Room Database, and State Management. The application allows users to manage their daily tasks efficiently through CRUD operations.

Project Scope

The application provides task management functionality with local data storage. Users can create, update, delete, and mark tasks as completed. All task data is stored locally using Room Database.

Technologies Used

- Kotlin
- Jetpack Compose
- Room Database
- MVVM Architecture
- State Management (StateFlow/Compose State)

Features

1. Add Tasks
2. Edit Tasks
3. Delete Tasks
4. Mark Tasks as Completed
5. Local Data Storage with Room Database

CRUD Operations

Create: Add a new task.

Read: Display all saved tasks.

Update: Modify an existing task.

Delete: Remove a task from the database.

State Management

The UI automatically updates whenever task data changes. State management ensures synchronization between the Room Database and the user interface.
